As result of survey, in order to identify students' awareness and interest in the BioArt project and the relevance of disciplines implementation, the following results were revealed.

Most respondents have information that this is innovative project in the field of biomedical engineering.

Most of respondents consider that it is necessary to modernize the educational process. All students (100%) have a positive attitude towards university participation in international projects along with leading European universities and are interested in participating in its further implementation. The majority of respondents (84%) in the field of bioengineering believe that orientation of curriculum on acquisition of practical skills in the field of artificial implants will increase their competence as future specialists. Respondents expressed their wishes for the creation of new laboratories and projects, and further implementation of such projects at university. For the most part, positive aspects of the respondents coincide with results of the project, as evidenced by their maximum (98%) interest in the possibility of receiving a diploma equivalent to the diploma of leading European universities after graduating from our university.

Most students are interested in receiving more information about the goals, objectives, opportunities of the BioArt project and want to participate in BioArt trainings, so this is relevant and useful.
